Interpolation

Definition

obtaining some function such that their values are identical to the given data

Definition

for given data

$$(t_i, y_i), \qquad i = 1, \ldots, m$$

we seek a function such that

$$\phi(t_i) = y_i, \qquad i = 1, \ldots, m$$

Polynomial Interpolation

Let $f(x)$ be the unknown function generating the data. We approximate $f(x)$ using a n degree polynomial $\phi_n(x) = \sum_{i=0}^{n} a_i \, x_i^i$ such that

$$f(x_i) = \phi_n(x_i), \qquad i = 0, \ldots, n$$

Polynomial Interpolation

that is $f(x_i) = \sum_i^n a_i \, x_i^i$

$(n-1)$ linear equations with coefficient determinant

$$\begin{vmatrix} 1 & x_0 & x_0^2 & \dots & x_0^n \\ 1 & x_1 & x_0^2 & \dots & x_1^n \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ 1 & x_n & x_n^2 & \dots & x_n^n \end{vmatrix}$$

Cubic Spline

Generally speaking, a spline is a polynomial of degree k with $k - 1$ times continuous differentiabilities.

Cubic Spline

Let $f(x)$ be a function defined in the domain $a \leq x \leq b$. We partition the function into subintervals $a \leq x_0 < x_1 \ldots < x_n \leq b$

We aim to find a cubic function $s_{3,i}(x)$ such that

$$s_{3,i}(x_i) = f(x_i), \quad i = 0, \ldots, n-1$$

Cubic Spline

in each subinterval $[x_{i-1}, x_i]$, cubic spline $s_{3,i-1}(x_{i-1})$ must meet :

1. $s_{3,i-1}(x_{i-1}) = f(x_{i-1})$ and $s_{3,i}(x_i) = f(x_i)$
2. $s_{3,i}(x_i) = s_{3,i+1}(x_i)$
3. $s'_{3,i}(x_i) = s'_{3,i+1}(x_i)$
4. $s''_{3,i}(x_i) = s''_{3,i+1}(x_i)$

Cubic Spline

Question :

A cubic spline polynomial has $4(n-1)$ parameters to be determined. How many parameters can be fixed based on the previous constrains?

Hermite cubic spline

Hermite condition

$$H_{3,i-1}(x_{i-1}) = f(x_{i-1}), \quad H_{3,i}(x_i) = f(x_i)$$

$$H'_{3,i-1}(x_{i-1}) = f'(x_{i-1}), \quad H'_{3,i}(x_i) = f'(x_i)$$

Akima

Given a set of knot points (x_i, y_i) with x_i strictly increasing, Akima spline go through all the points and determine the slope for each point as a weighted average of the scants of two points before and after.

$$\boldsymbol{s}_i = \frac{|m_{i+1} - m_i| m_{i-1} + |m_{i-1} - m_{i-2}| m_i}{|m_{i+1} - m_i| + |m_{i-1} - m_{i-2}|}$$

Steffen

estimate the slope of internal points through a unique parabola determined by three neighbouring points to ensure the monotonic behaviour of interpolation

$$p_i = \frac{s_{i-1}h_i + s_i h_{i-1}}{h_{i-1} + h_i}$$

where $h_i = x_{i+1} - x_i$ and $s_i = \dfrac{y_{i+1} - y_i}{x_{i+1} - x_i}$

If $f \in \mathbb{R}$ and $m \in \mathbb{Z}_{\geq 0}$, then

$$\int_{-\infty}^{\infty} x^m f(x)dx$$

if it exists, it is called the moment of f of order m.

f has the **vanishing moments** to order M if the moment of f of order $m = 0, 1, \ldots, M$ are all 0.
