

VirtualBox

Start the VirtualBox application and click on the “Open a saved Virtual Box”. Locate the the Ubunt_26.04_VB.vbox

VM Settings

Click on the Settings icon.

Pay attention if you do not see Ubuntu (64bit) but only Ubuntu (32bit) means that your BIOS is not set for virtualization (see example at <https://goo.gl/Zgq14A>)

Virtual Machine settings

In VirtualBox → setting → General

Set Shared Clipboard and Drag and Drop to Bidirectional Optional.
Do not change the Snapshot Folder

Set memory size

Set the memory Size (6G). The dedicate RAM for the VM can change according to the RAM of your host-pc. Do not overpass the green area!

Increase the processors (2CPUs) only if your VM is too slow.

Remember you can change these options only when the VM has been shout-down.

Set display

Set the Graphics Controller to VMSVG

(in case the View → Autoresize Guest Display is not working properly try to test the other options)

Sharing folder

Create an empty folder named LVM_shared in your OS

MAC OS X: /Users/yourname/LVM_shared

Windows OS: C:\Users\yourname\Documents\LVM_shared

Linux: /home/yourname/LVM_shared

Sharing folder

Add new shared folder in VirtualBox → setting → shared folders →
Click “Machine Folders” and navigate to the host OS LVM_shared folder.
Activate the Auto-mount option and click OK

Start the Virtual Machine

At this point you can press the start arrow to boot the Linux Virtual Machine

Select Ubuntu
password ubuntu
Then press enter

Always shutdown the
VM clicking:
Spiral Icon > type power
> Press Power of
